

For Immediate Release

Arcadia Aerospace Industries, LLC (“AAI”) of Punta Gorda, Florida and Ultrasonic Sciences LTD (“USL”) of Aldershot, England announce their agreement to market and sell Non-Destructive Ultrasonic Testing (“NDT”) Systems and Support Services to the Aerospace Industry on an exclusive basis in the United States and Canada.

The effort, based in AAI’s Florida facilities, will combine cutting-edge USL instrumentation and software technologies with AAI design, engineering and integration expertise. The Support Services group is formed to provide new, turn-key NDT systems and to allow current NDT users the flexibility to upgrade their installed machinery and systems from other manufacturers. The group will provide users of automated complex contour-following systems an advanced software and hardware upgrade platform capable of faster, more efficient complex geometry inspections. Training, integration, calibration, maintenance, repair, and support will also be provided directly from the Florida location. The venture brings together the unique capabilities of two companies in automated NDT.

Ultrasonic Sciences LTD is a European leader in the development and manufacture of NDT Software and Systems, being first to introduce automated PC based, conventional and phased array NDT Systems specifically designed for extremely high speed inspection of composite structures.

Arcadia Aerospace Industries, in addition to system support services, provides manufacturers an alternative to in-house NDT, specializing in the inspection of flight critical, complex composite and metal structures such as those found on the new HondaJet aircraft currently undergoing certification.

Together, USL and AAI will bring unsurpassed quality, reliability and customer service to the Aerospace Industry in the US and Canada.
